

**Pay in slices.
Leave with a record
nobody can rewrite**

Relia — hire-purchase title, proven across chains.

Built for BUIDL CTC 2026 Fall · Creditcoin + Credit Labs

`relia-live.vercel.app`

Live on Sepolia + Creditcoin testnet

The shop's notebook is the only record.

A buyer in Lagos pays for a generator in twelve installments. That schedule lives in a shop's notebook. If the shop says she missed month five, she missed month five.

She cannot prove otherwise, and none of it follows her to the next shop. Her payment history — the most valuable thing she is building — belongs to someone else.

A title slice must be earned twice.

A title slice does not exist until the Attestcoin Protocol proves two finalized Sepolia transactions in one batch — a **successful** installment payment, and the shop's acknowledgement citing that exact payment hash — and neither hash has been consumed while the window is still open.

Money settles on Sepolia. Creditcoin holds title and tape. Nothing is bridged.

Proof travels. Money does not.

Attestcoin is not a third chain. It is the readability path on Creditcoin — the precompile plus the decoder let a Creditcoin contract read a Sepolia fact.

A shop must not profit from its own silence.

Take the payment, never acknowledge it, wait out the window, reclaim the slice — and leave a false miss on the record of a buyer who actually paid. So the outcome depends on what was proven:

AT WINDOW END	TAPE STATE	RECLAIM
No proven payment	Shortfall	allowed
Payment proven, no valid ack	Disputed	blocked , payment hash published
Valid batch consumed in time	Live	blocked, permanently

The hash is recomputed on Creditcoin.

The gap

The Block Prover attests to a transaction's *contents*, not its hash. "The ack cites that exact payment" would have been a check against a number the worker supplied itself.

The fix

LibTxHash rebuilds the canonical EIP-1559 serialization from attested fields and hashes it — so the hash is exactly as trustworthy as the proof.

Stated limitation: type-2 with an empty access list only. Anything else is refused, never mis-hashed.

Live testnet, not a mock.

2026-09-09 — Sepolia payment 0x0e07b1fd...e355d8 and acknowledgement 0xf4b28cdf...9786190 were consumed by Creditcoin transaction 0x0fd7b431...27405ab2 in block 5457260. InstallmentReceipt emitted; title slice 1 is live.

What this is, and what it is not.

Built and live

Contracts on both chains, batch proof consumption, Shortfall/Disputed settlement, soulbound title, append-only tape, proof worker with no custody, and a public app where reading needs no wallet.

Out of scope

No KYC, no fiat rails, no credit score, no bridging of real USDC, no bond vault, no token, no governance. Hello Bridge / Loan Flow tutorials were not run green.
